Asphalt seal coating is a surface treatment designed to seal and protect the asphalt pavement from harmful environmental conditions such as sunlight, rain, and snow. The seal coat prohibits water from infiltrating through the pavement and deteriorating the base of materials beneath the pavement. However, the seal coating will not correct any existing issues with the material below the asphalt. Surface treatments work well where the distresses are limited to pavement surface deterioration or where cracks are minor.

The current seal coat products are designed to last between five to eight years with weather conditions driving the variation in its lifespan.
